SKILLS AUDIT OF THE AUSTRALIAN SPACE SECTOR

Abstract

The Australian Space Coordination Office along with industry partners recently conducted a skills audit of the Australian space sector in order to develop a deeper understanding of the space skills base in Australia.

The results of this audit revealed the skills required to support space activities in Australia now and in the future, the supply and demand for these particular skills, recognise the future skill sets required and the challenges these pose, and identify ways to address these challenges. The audit may also provide a comparative industrial model for other emerging space nations to consider.
