SPACE TERMINOLOGY, TECHNOLOGY DEVELOPMENT AND INTERNATIONAL
COOPERATION: INDONESIAN PERSPECTIVE

Abstract

Cultural background is relevant and has to be considered in defining space terminologies that follow linguistic roles and facilitate international communication. Aspects relevant to such considerations are analyzed and identified, such as public acceptance in various social strata and convenience for international communications. Appropriate choice of terminologies not only avoids confusion, but may contribute to information mining and knowledge dissemination. This could motivate indigenous technology development. The analysis and discussion will be summarized into practicable space terminologies guide lines.
