RESEARCH ON THE APPLICATION OF SMALL SATELLITE

Abstract

Aerospace industry has always been a huge project, expensive, and its high cost of development, design and test to the development of the aerospace industry has brought some constraints. With the development of science and technology and the development of electronic technology, the small satellite has gradually emerged from its advantages such as high integration, low cost, low transmitting power, short development cycle and so on. This paper combines the function of small satellite the development direction of the market categories, are studied and summarized, and further refine the value of small satellite in scientific research and economic construction and other fields, and promote the integration of the aerospace industry and the depth of the national life.
