ASTRAX UNIVERSAL SERVICES PLATFORM BY USING BLOCKCHAIN TECHNOLOGY

Abstract

The area of human activity is going to spread to the earth, space, moon, Mars and others.

Towards such a time, ASTRAX is using block chain technology to develop a unified space economic zone platform on the solar system scale.

In the space block chain platform, it is possible to efficiently match what is needed for a person living in outer space including the earth, and a service provider that provides them.

To that [end, we aim to] issue a dedicated space token that can be used on Earth, space, moon or Mars to allow exchange of the value of goods and services on the platform.

Also, we will make a service on all the products and services that are necessary for living in outer space, moon and Mars, on the premise that sharing is possible as much as possible from the beginning.

First of all, I tried to operate between the virtual city called ASTRAX Moon City and the existing living area on Earth, and then used for real lunar city development, spaceship, space hotel, Mars etc. It is assumed that it will expand to. In this presentation, we will present the outline of the concept and present the results so far.
