SUSTAINABLE DEVELOPMENT IN OUTER SPACE: TOWARDS A UNIFORM POLICY
COMPLIANCE

Abstract

Outer Space missions require and use energy and resources. In order to guarantee that future generations will have the same chances and opportunities regarding the use, exploration and exploitation of Outer Space, humans should draw common policy instruments capable to prevent environmental issues affecting non terrestrial environments and the Environment on Earth. This paper will compare the existing environmental status regarding Outer Space and draw a road-map to reach a uniform policy instrument capable to regulate sustainable solutions from a soft-law perspective
