PROFESSIONAL USE OF PARAPSYCHISM AT SPACE EXPLORATION

Abstract

Parapsychism is a physiological resource of the human being, thus natural, capable of being developed just like other skills, such as walking and talking. This article, based on this premise, intends to demonstrate the numerous practical applications of different parapsychic resources in space exploration, their risks and potentialities: as a cognitive communication and maintenance tool for the physical and mental health of astronauts.

To achieve this goal the techniques and theoretical content will be presented based on the Consciential Paradigm, a reference for scientific research in Projectiology and Conscientiology, both sciences proposed in Rio de Janeiro, Brazil, respectively in the years 1986 and 1994 - by the Professor Doctor in Aesthetics, Physician and psychic Waldo Vieira (1932-2015).

The parapsychism is the set of advanced perceptions, due to the natural or voluntary occurrence of altered states of consciousness, beyond the 5 basic senses of the human body. One of the premises of Projectiology is the capacity of consciousness to manifest itself in the physical and extraphysical dimensions, using 4 energetic bodies for this purpose. This set of bodies is called holosoma, and its constitution is didactically described: soma (the human body - the only physical); energosoma (the energetic body is the set of consciential energies that binds the emotional body to the human body - bioenergies); psychosoma (the body of emotions is a perfect copy of the human body (soma). The psychosoma is much lighter and more subtle than the soma) and mentalsoma (mental body; the extraphysical body of self-discernment of the consciousness). During our intraphysical existence (the biological life) we have these 4 bodies united in energetic resonance. Parapsychism is nothing more than the use of sensory resources, which are physiological, of the 3 extra-physical bodies, when they are temporarily, partially or totally, disassociated, from the physical body (the most complex of these phenomena is the lucid projection – a classic example is: the near death experience).

Considering that the knowledge and practical mastery of such resources must be included in the training of astronauts, new experiments, now using the knowledge of Projectiology, can be carried out in Earth orbit, just like the experiments conducted by the astronaut Edgard D. Mitchell, as well as in analog stations existing on the surface of our planet, for example: the Habitat Marte space analog station (Brazil) and Mars Desert Research Station (USA).
