HUMAN COLONIZATION OF THE SURFACE OF VENUS AND ITS BOWELS RIGHT NOW.

Abstract

Conditions on the surface of Venus are quite extreme, and everyone knows it. However, there are many projects that involve the deployment of inhabited bases only in the atmosphere of Venus, where temperature and pressure conditions are close to those on Earth. There are also projects for terraforming Venus, but they are too long in terms of implementation - hundreds and thousands of years. By shading the planet, you can meet it in a shorter time, but the creation of reflectors will be extremely expensive. The report proposed by the author shows how quickly a human settlement can be implemented by creating bases right on the surface, on Venus, already within the first ten years! In addition, digging mines, underground tunnels, passages, galleries under the surface of Venus with comfortable living conditions, with a little funding, I can start right now!
