A LEGAL EXAMINATION OF CURRENT ISSUES AND CHALLENGES IN INTERNATIONAL  
SPACE LAW

**Abstract**

The presentation focuses on current legal issues in international space law. The space industry is rapidly developing. Such growth necessitates the establishment of an appropriate legal framework. The presentation will examine the most important normative legal acts governing relations in outer space today, as well as current development trends and problems. Space law is a relatively new area of international public law that combines customs and treaties. The space industry's legislative framework is expanding in response to the regulated subject. The presentation will address the issue of finding a balance between free access to space for humanity and the ability to establish ownership of specific study objects in outer space. The ability to develop private enterprise, company, and research centre ownership rights is critical for the economic development of the space industry. This presentation aims to provide a comprehensive understanding of current trends and challenges in space law, with a focus on issues such as space tourism and climate change. The presentation will look at the founding treaties of space law, as well as the legal framework and scientific literature on the subject. The presentation's main goal is to highlight new trends and prospects in space research, the exploration of new perspectives that are currently available in the field of outer space, and the search for solutions within the framework of legislative regulation. Keywords: legal issues, international space law, legal framework, outer space, space tourism, climate change
