HAND SIGNALS FOR MULTINATIONAL SPACE TRAVELERS

Abstract

Right now, most participants in space travel can speak English, the universal language, but as time goes on, English speakers will not necessarily participate in space travel. As with the travel industry on Earth, multilingual support will be desired.

Therefore, we propose "hand signals" as a common language for earth and space. We believe that hand signals are effective not only for those who cannot speak English, but also for those who are hard of hearing. We propose hand signals as a tool that allows everyone to enjoy space travel while communicating with each other.
