IT TAKES A VILLAGE TO SAVE A CIVILIZATION: A STUDY ON OVER-ARCHING EFFECT OF
MOON VILLAGE ON HUMANITY

Abstract

Purpose: The purpose is to establish that a Moon village would be an efficient society and produce results that affect Earth's society. It can lead to creating social examples that can become the basis for creating a model of global society with its innovation and modern and planned social structure.

Methodology: We will deep dive into the modern understanding of how societies work, contrasting it with science and innovation. By doing so, we can create a pragmatic analogy of how we can ensure the success of such a Moon village in the first place. These parameters will then be used to justify their usability in the current or pre-emptive future of the world. The impacts on social, cultural, political, and economic aspects will be evaluated with further parameters.

Results: We have identified four parameters: Dissemination, Transfer, Impact, and Social Creation. Social improvement only occurs if impacts are achieved since dissemination alone does not ensure knowledge application, and transfer alone does not ensure that its application generates improvement; sometimes it even leads to deterioration. The new concept of social creation goes beyond that and defines the process in which new successful social realities emerge from social research itself, improving society in ways that did not exist before. Social creation becomes the tool to create structures in the Moon village where everyone has pre-determined roles in society. This system of interdependency, although similar to the current society, would work more efficiently in the case of the Moon village due to the factor of survival. This division of labor includes intellectuals from all classes and disciplines who play their roles to fulfill all burdens and needs.

Conclusion: Hence, we can say that in such Moon villages, not only is self-sustainability important, but due to its cooperative nature, it becomes necessary to follow societal structures. This can serve as an incubator to correct our global mistakes and could even lead to the creation of new societal ideas and policies. It also promotes the cultural importance of all our needs and how they develop over time in completely distant lands. In such self-sustaining societies, the importance of equality prevails because it glorifies the interdependencies that are strictly followed, driven by the evolution of such societies in the shadows of strict Standard Operating Procedures for community safety and overall survival. It allows us to study the formations of factions of society.
